representative of expressed polymucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polymucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrosse-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       152
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         180

Novel plant PII (also called P-PII) nuclectide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     7 GAGGCTACTGCGAAACTGGGCTTGCTCCTCTCTTCTAATAACATCAAGAAA66

The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              rrcchsrrrrsarrrcasrrrstrrrrsrcasascrrasacarrccssrrrrcrac 175

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           534
                                                                                                                                                                                                                                                                 The present invention relates to a Moraxella catarhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF28554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarhalis (Branhamella catarhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarhalis is known to cause acute, localised infections such as ottics media, sinustics and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       354
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              414
                                                                                                                                                                                  Genomic library for identifying diagnostic and therapeutic compositions, and for identifying virulence factors, regulatory elements and drug targets, comprises Moraxella catarrhalis nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents DNA encoding an A. baumannii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      229 ATTAGTGATGAAATGGTCGACGCGGTAATTGAGTCAATTACACGTGTGGCAAGCACTGGA

                                                                                                                                                                                                                                                              retratreatateatateceaegaatecaaegaeceaegaaacceaegaegatesaaaateit 13100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphisms are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that anothiate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P.
                                                                                                                                                                                                                                 TGTAATCAACACAATAATTGAAGGAGCAAGGACAGGAGAGATTGGTGATGGCAAGATTTT 497

                recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The egenes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens genes
                                                                                                                                                                                                                                                                                                                                                                      64

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and comparisons that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABZ37706-ABZ42016 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              92 adaticisciatitacesiscatisacisticas estas estas adas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas estas

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent pecifically claimed Neisseria meningidia genomic DNA sequences. AAA81260 to AAA81203 and AAB25620 to AAB25663 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81240 to AAA81221 represent PCR primers used in the isolation of AAA81321 represent PCR primers used in the isolation of Neisseria meningitidis MenB polyrucheotide ORF sequences, which are all used in the exemplification of the present invention. The mucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition of the present invention. The used is medicament (or in the manufacture of a medicament) for treating, the manufacture of a medicament) for treating, corresponding or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all apply pathogenia Neisserial abeterium and all and apply and antibodies and and application of sequences from the bacterium and all and apply and antibodies and and apply and antibodies and and apply and antibodies and and apply and antibodies and and apply and antibodies and and apply and antibodies and and apply and antibodies and anti

will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also ben tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins

Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea.

The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants Novel P-PII genes capable of requiating plant nitrogen assimilation, useful for transgenic plant production, and as probes for isolating additional genomic clones having P-PII gene promoters. Description

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitros screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
